

**Amendments to the Specification:**

Please amend the paragraph starting on page 8, line 8 with the following replacement paragraph.

-- Referring now to Figure 5, another embodiment of the package is shown. In the illustrated embodiment, the fifth panel is integrally connected to the carton along one edge. This allows the fifth panel to be rotated away from the bottom panel, where it may be held in position by a fastening element, into a position extending from the sidewall as illustrated. The fifth panel contains an adaptor aperture 62. The adaptor aperture is utilized with a beverage container 64 (such as a soda can or bottle) or with the adaptor member 50 to secure the carton to a cup holder 66 including a bottom 90 for supporting the beverage container and a side support 92 for contacting the sidewall of the beverage container. The bottom 90 and side support 92 form a circular depression 94 for holding the beverage container. When using the carton in this manner, the fifth panel is rotated away from the bottom panel, positioned over the cup holder, and then the beverage container is inserted through the adaptor aperture securing the tissue carton. --
